

GoldLime

LIQUID LIME WITH TRACE ELEMENTS

Specifications

	%W/W
Calcium (Ca)	20.00
Magnesium (Mg)	0.15

Lime Equivalent	47.90%
Specific Gravity	1.5

typical analysis

Goldlime is micronised calcium carbonate, combining a 50/50 blend of one of NZ's finest limes & a soft golden fossilised seashell and coral lime imported from Australia. It is totally natural (organic) and contains not only Calcium and Magnesium but also naturally occurring levels of important trace elements such as, Manganese, Zinc, Copper, Cobalt, Molybdenum and Boron.

Warranty & Disclaimer: We guarantee the specifications & quality of our products, however as application equipment varies and if application instructions and rates are not adhered to, Agrifert accepts no responsibility or liability towards the user or any third party.

Application Instructions

Recommended Rate: 15-30 litres per hectare. Application rates may be varied depending on the soils fertility & pH levels.

Water Rates: Pasture. Mix one part Gold Lime to four parts water, e.g. Water rate: 4:1 (water: Gold Lime). Mix before use and keep well agitated until spread. Horticultural & other water rates available on request

Recommendations: The best conditions for application are early morning or evening with minimal wind and preferably no rain for at least two hours after application. Gold Lime can be applied with most foliar fertilisers. We recommend mixing and applying to a test area first before blanket application, if adding another product.

Caution: Remove fine filters from spray equipment before application. Gold Lime is not suitable for a C Dax type handheld or knapsack sprayers. Do not mix until ready to apply. Mix and spread straight away. DO NOT LEAVE STANDING FOR ANY LENGTH OF TIME. This can affect product consistency and further agitation may be required. Thoroughly clean all spray equipment after use

If you are unsure about any of these instructions, your spray equipment compatibility or the compatibility of a foliar fertiliser please call:
